

OVD Enterprise 3.4

Inuvika OVD Enterprise delivers Windows and Linux applications and desktops to users on any device, anywhere. It's a robust virtualized application solution that centralizes data and applications and protects sensitive corporate information while creating safe, remote-accessible digital workspace environments.

Work-From-Anywhere

Provide secure remote access to employees without a VPN.

Data Protection

Apps and data are safely stored within your cloud data center

Legacy Apps

Maintain legacy apps by moving them into the cloud

PC Alternatives

Instantly access virtual workspaces on any device

Fast and Scalable Deployment

OVD installs in hours, not days, without the need for expensive consultants. Deploy on-site, in private-public clouds, or access it as a service. OVD works with today's leading enterprise standards for smooth and easy deployment. Integrated multi-tenancy uses one instance of OVD to deploy services across multiple domains without sacrificing tenant data privacy.

Great User Experience

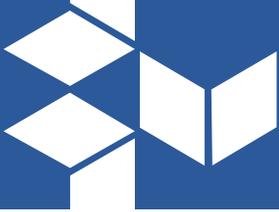

OVD delivers a fast user experience that is familiar and easy to use on any device. Access Windows and Linux applications, shared and dedicated desktops on Mac, Windows, or Linux PC; iOS/Android mobile devices; Chromebook; or any HTML5 Web browser. OVD also supports lower-cost Raspberry Pi-based thin clients that can dramatically reduce PC infrastructure costs without impacting compatibility with business-critical and legacy applications.

Comprehensive Security

OVD's comprehensive approach to security protects corporate data and makes remote access safe and secure.

It centralizes applications and processing of data within your private or public cloud data center. No data ever resides on the endpoint device. Additional granular user policy management gives Administrators the power to control the use of data. Support for biometric devices and integrated Two-Factor-Authentication provides added protection against unauthorized access.

Inuvika's Enterprise Secure Gateway provides secure remote access to virtual workspace environments without the need for a VPN. OVD uses standard security ports, so no custom ports are needed, further reducing network exposure points.

Management Made Easy

Inuvika's centralized management reduces support costs and simplifies application delivery. The single Web-based management console allows you to manage every aspect of OVD - tenants, servers, applications, and users - while built-in tools like OVD Messaging, OVD Service Notices, and Shadowing help administrators troubleshoot user issues remotely.

Lower IT Costs

Save up to half the cost of other solutions like Citrix and VMware.

OVD Enterprise lowers the total cost of ownership compared to other solutions. Its modern design requires less hardware overhead and centralized management frees up valuable field support resources. OVD is available as an all-inclusive OPEX subscription program, so there are no hidden fees or multiple editions to consider.

Lower Your Carbon Footprint

OVD Enterprise requires much less back end infrastructure. Savings in power requirements in data centers along with extending the life of desktops by converting them to thin clients, will help lower your carbon footprint.

Provisioning, Monitoring and more!

OVD Enterprise 3.4 adds a host of new features into the product:

- **Provisioning Integration:** You can now connect the OVD Session Manager directly to your preferred virtualization platform, whether on-premises, cloud, or hybrid. Supported platforms include Proxmox, Nutanix AHV, VMware, Hyper-V, and cloud providers like AWS, Azure, and GCP. Using Terraform, you can deploy shared or dedicated OVD Application Servers on demand, with templates available for Windows or Linux environments, and even set schedules for working hours.
- **Monitoring:** A new feature connects the OVD Console to InfluxDB-compatible platforms like Grafana or logs to a file on the OVD Session Manager for collection by your monitoring platform.
- **Admin Console Improvements:** The admin console now includes Dark Mode with a theme switcher that follows system preferences, along with enhanced terminology and descriptions for easier navigation.
- **Software License Enforcement:** Updated licensing management enforces software license limits for compliance, helping MSP/CSP partners avoid license overuse on DaaS platforms.
- Other updates include automatic maintenance alerts, a refresh button for on-demand server updates, improved multi-tenant filtering, changes to authentication throttling, upcoming clipboard enhancements, and online licensing for easy compliance.
