

OVD Enterprise 3.5

Inuvika OVD Enterprise delivers Windows and Linux applications and desktops to users on any device, anywhere. It's a robust virtualized application solution that centralizes data and applications and protects sensitive corporate information while creating safe, remote-accessible digital workspace environments.

Work-From-Anywhere

Data Protection

Legacy Apps

PC Alternatives

Fast and Scalable Deployment

OVD installs in hours, not days, without the need for expensive consultants. Deploy on-site, in private-public clouds, or access it as a service. OVD works with today's leading enterprise standards for smooth and easy deployment. Integrated multi-tenancy uses one instance of OVD to deploy services across multiple domains without sacrificing tenant data privacy.

Great User Experience

OVD delivers a fast user experience that is familiar and easy to use on any device. Access Windows and Linux applications, shared and dedicated desktops on Mac, Windows, or Linux PC; iOS/Android mobile devices; Chromebook; or any HTML5 Web browser. OVD also supports lower-cost Raspberry Pi-based thin clients that can dramatically reduce PC infrastructure costs without impacting compatibility with business-critical and legacy applications.

Comprehensive Security

OVD's comprehensive approach to security protects corporate data and makes remote access safe and secure.

It centralizes applications and processing of data within your private or public cloud data center. No data ever resides on the endpoint device. Additional granular user policy management gives Administrators the power to control the use of data. Support for biometric devices and integrated Two-Factor-Authentication provides added protection against unauthorized access.

Inuvika's Enterprise Secure Gateway provides secure remote access to virtual workspace environments without the need for a VPN. OVD uses standard security ports, so no custom ports are needed, further reducing network exposure points.

Management Made Easy

Inuvika's centralized management reduces support costs and simplifies application delivery. The single Web-based management console allows you to manage every aspect of OVD - tenants, servers, applications, and users - while built-in tools like OVD Messaging, OVD Service Notices, and Shadowing help administrators troubleshoot user issues remotely.

Lower IT Costs

Save up to half the cost of other solutions like Citrix and VMware.

OVD Enterprise lowers the total cost of ownership compared to other solutions. Its modern design requires less hardware overhead and centralized management frees up valuable field support resources. OVD is available as an all-inclusive OPEX subscription program, so there are no hidden fees or multiple editions to consider.

Lower Your Carbon Footprint

OVD Enterprise requires much less back end infrastructure. Savings in power requirements in data centers along with extending the life of desktops by converting them to thin clients, will help lower your carbon footprint.

Enterprise Platform
Refinements

Refinement, Performance and More!

OVD Enterprise 3.5 delivers a focused set of enhancements that further refine the platform, improving everyday usability, performance, and administration across enterprise environments.

- **Local App Access & User Experience:** OVD Enterprise 3.5 introduces Local App Access, allowing files opened within an OVD session to launch seamlessly in the corresponding application on the user's local device where appropriate. This reduces latency, improves responsiveness, and gives administrators greater control over where applications run. Application Mode has also been refined across Windows, macOS, and Linux clients, delivering more predictable window behaviour, improved keyboard handling, and a more native application experience.
- **Protocol & Client Enhancements:** OVD now leverages a modernised remote display stack, delivering improved performance, enhanced protocol capabilities, and a more robust foundation for future development. The Enterprise Desktop Client for Windows is now 64-bit native, while the macOS client runs natively on Apple Silicon for improved stability and performance.
- **Authentication, Security & Operations:** Passwordless SAML2 authentication streamlines access for domain users while maintaining enterprise security standards. Administrative workflows have been refined with expanded monitoring, cleaner session management, improved Active Sessions stability, and logs displayed in the server's local timezone. Cloud-friendly File Server improvements enhance reliability in public cloud environments, alongside better browser profile handling and refined device, clipboard, and gateway behaviour.
